Loihi

KEY PROPERTIES

- 128k neurons and 128 million synapses
- Compute-memory integrated architecture
- Fully digital in standard 14nm process
- Asynchronous design enables scalability
- Versatile on-chip learning – a first for the field

Yet,

- No floating point numbers!
 - No multiply-accumulators!
- Fundamental to deep learning hardware

Beyond Today's AI

New algorithmic approaches emulate the human brain's interactions with the world.

Neuromorphic Computing Community Probabilistic Computing Resources

The emergent capabilities in artificial intelligence being driven by Intel Labs have more in common with human cognition than with conventional computer logic.

HIGHLIGHTS

- Neuromorphic computing research emulates the neural structure of the human brain.
- The Loihi research chip includes 130,000 neurons optimized for spiking neural networks.
- Intel Labs is making Loihi-based systems available to the global research community.
- Probabilistic computing addresses the fundamental uncertainty and noise of natural data.
- Collaborations on next-generation AI extend to worldwide industry and academic researchers.

What Is Neuromorphic Computing

The first generation of AI was rules-based and emulated classical logic to draw reasoned conclusions within a specific, narrowly defined problem domain. It was well suited to monitoring processes and improving efficiency, for example. The second, current generation is largely concerned with sensing and perception, such as using deep-learning networks to analyze the contents of a video frame.

A coming next generation will extend AI into areas that correspond to human cognition, such as interpretation and autonomous adaptation. This is critical to overcoming the so-called "brittleness" of AI solutions based on neural network training and inference, which depend on literal, deterministic views of events that lack context and commonsense understanding. Next-generation AI must be able to address novel situations and abstraction to automate ordinary human activities.

Intel Labs is driving computer-science research that contributes to this third generation of AI. Key focus areas include neuromorphic computing, which is concerned with emulating the neural structure and operation of the human brain, as well as probabilistic computing, which creates algorithmic approaches to dealing with the uncertainty, ambiguity, and contradictions of the natural world.

Neuromorphic Computing Research Focus

The key challenges in neuromorphic research are matching a human's flexibility, and ability to learn from unstructured stimuli with the energy efficiency of the human brain. The computational building blocks within neuromorphic computing systems are logically analogous to neurons. Spiking neural networks (SNNs) are a novel model for arranging those elements to emulate natural neural networks that exist in biological brains.

And now a conversation that will fire up everyone's neurons with Mike Davies, Director of Neuromorphic Computing at Intel Labs. Follow [#BehindTheBrains](#) to keep track and enjoy the thread

Reimagining the Future of AI-assisted Software Design

Justin Gottschlich

Principal Engineer, Machine Programming Research

Labs Day 2020

How do you develop software to fully exercise the capabilities of these novel types of hardware?

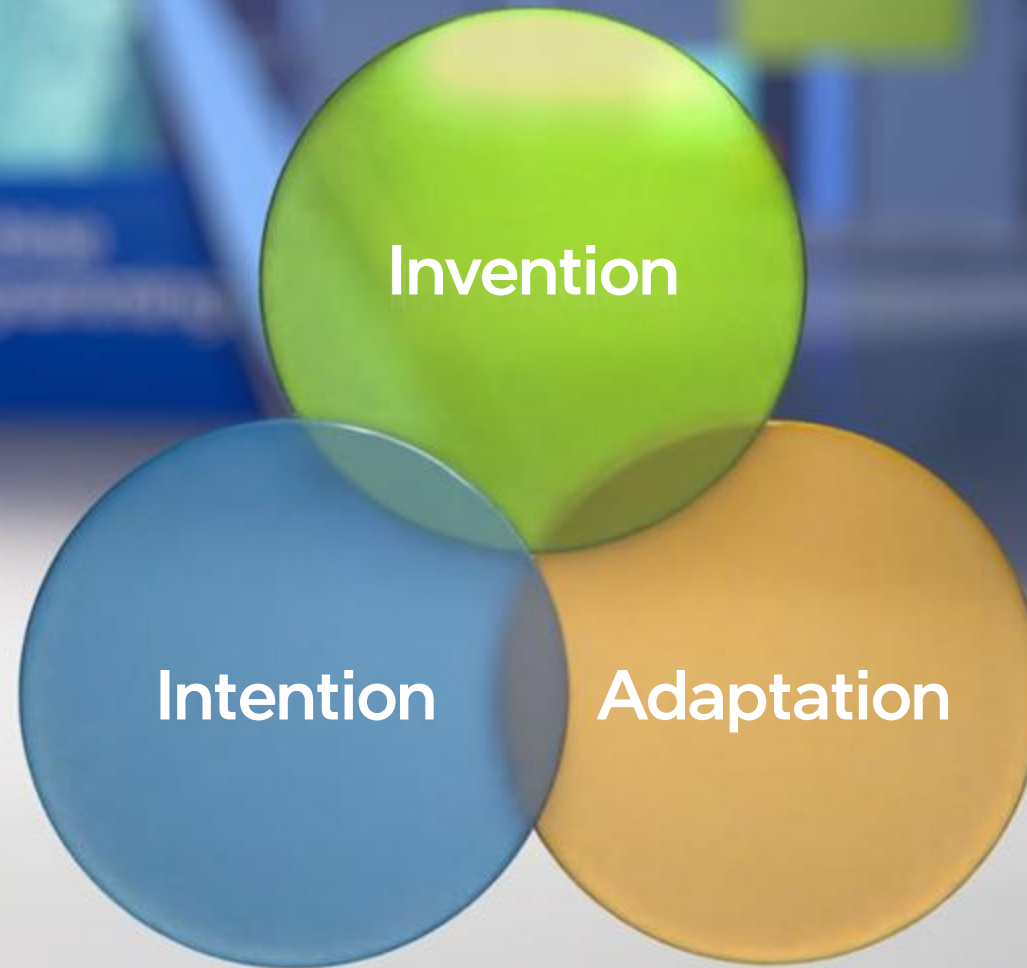

Machine Programming

- Any technique that automates software development

Intel's goal with MP

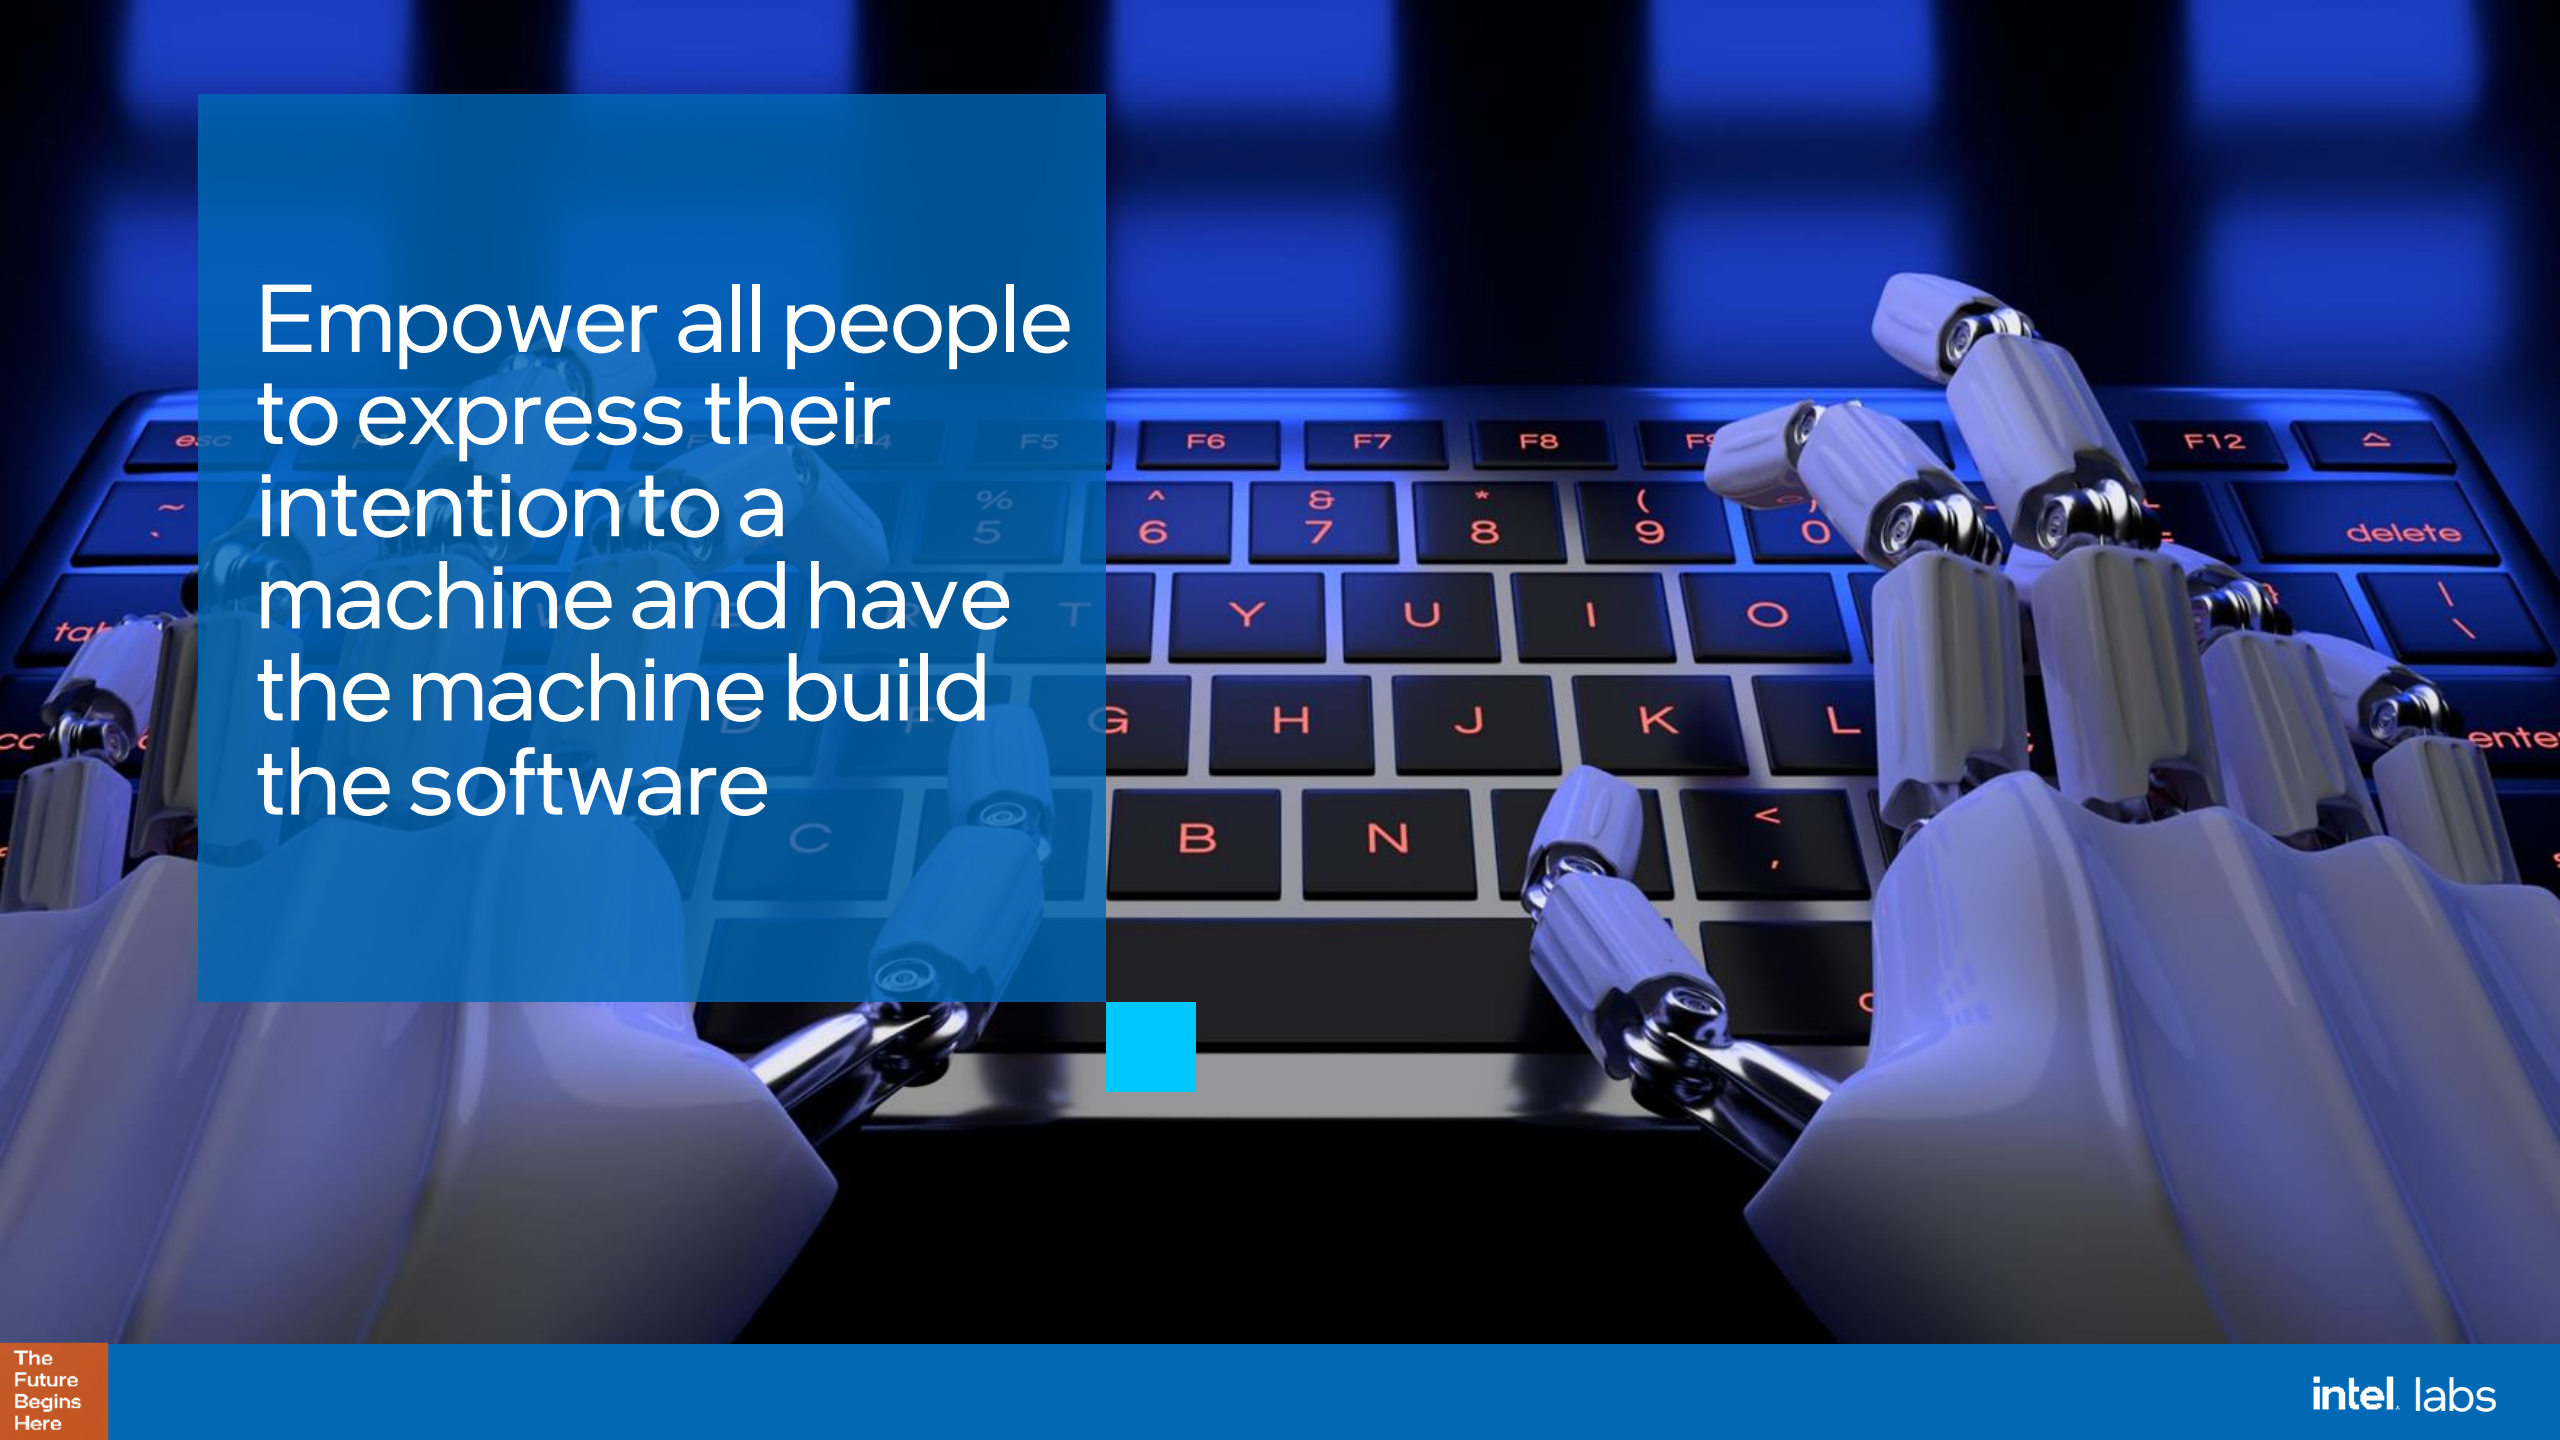

- Democratize and accelerate the creation of quality software

The Three Pillars of Machine Programming

Less than 1% of the global
population can code.

Empower all people
to express their
intention to a
machine and have
the machine build
the software

Programmers spend
50% of their time debugging

Can we do better?
